

Security Incident Quick Reference

REF-SEC-002 | Version 1.1 | Confidential - internal

Sample training content for learning MkDocs: [convert this PDF into Markdown under docs/](#).

If you suspect a security incident

Examples: phishing that was clicked, ransomware symptoms, lost device with data, unexpected admin prompts, data emailed externally by mistake.

- Do not power off a potentially compromised device unless instructed (preserve evidence) - disconnect network if malware is active
- Contact Service Desk and mark ticket Security
- Notify Security CSIRT for confirmed or high-confidence events
- Do not delete emails or files that may be evidence

Phishing reports

- Use Report phishing button in Outlook
- Forward as attachment only if button missing
- Never enter credentials on linked pages from suspicious mail

Service desk first response

Isolate account if credential theft is likely: reset password, revoke sessions, review MFA methods. Escalate to CSIRT with timeline.
